Why This Guide, and What the Numbers Actually Tell Us

It is tempting to assume cyberbullying is a problem for other families, or that a child's phone is simply not that big a part of their life. The data suggests otherwise, and it is worth sitting with for a moment before the rest of this guide.

A nationwide study of Sri Lankan schoolchildren, carried out with UNICEF, found that just over half were regularly online, with the average child first getting internet access around age 13 — which, in practice, is usually the year a first personal phone appears, often justified by the need to coordinate tuition classes. Separate national research put the share of internet-using children who had experienced cyberbullying at roughly 4 out of every 100. That figure is almost certainly an undercount: researchers who ran the survey noted that many children do not think of apps like WhatsApp as “the internet” at all, so harassment happening there often goes unreported in surveys, even when it is happening to them. A later, independent study focused on older teenagers found rates several times higher — closer to 1 in 6 — which is more in line with figures from other countries.

The honest summary: nobody has an exact number for Sri Lanka, and the true figure is probably higher than the headline statistics suggest. What is not in question is that bullying in general remains common in Sri Lankan schools, that it increasingly has a digital dimension, and that most of it happens quietly, without a parent ever being told directly. That last point is really the reason this guide exists — not to alarm you, but because waiting to be told is, for most families, waiting too long.

1. What Is Cyberbullying, Really?

Cyberbullying is repeated, intentional harm carried out through digital technology — phones, apps, games, or social media — where there is some imbalance of power between the person doing it and the person on the receiving end. That power might come from popularity, from numbers (a group versus one child), from anonymity, or simply from one child having something to hold over another, like a screenshot or a photo.

That definition matters because not every unkind message is cyberbullying, and treating every conflict as if it were can actually make things harder for a child to navigate. A single thoughtless comment, a joke that landed badly, or a one-off argument between friends is, more often than not, ordinary — if uncomfortable — social friction, and it usually resolves itself with an apology or a bit of space. Cyberbullying is different in three specific ways: it repeats, it is deliberate, and the target struggles to make it stop on their own.

WHERE THE LINE SITS

Two twelve-year-olds have an argument in a class group chat and both call each other names once. Unpleasant, but likely ordinary conflict. If, over the following two weeks, one of them is added back into the group specifically to be mocked, screenshots of the argument are shared to three other groups, and the same child is left out of every plan that follows — that is no longer an argument. That is cyberbullying.

The medium changes the shape of the harm in ways worth naming directly: it can follow a child home, so there is no safe room to retreat to; it can happen in front of an audience that keeps growing as things are forwarded; it can be permanent, since a screenshot outlives a deleted message; and it can be anonymous, which tends to make it feel more frightening, not less.

2. How Cyberbullying Shows Up

In Sri Lankan schools, cyberbullying rarely looks like the dramatic, stranger-danger scenario many parents picture. Far more often, it involves people your child already knows, happening inside spaces that exist for entirely ordinary reasons — the class WhatsApp group, a tuition batch chat, a gaming Discord. Recognising the everyday forms it actually takes makes it much easier to notice when something has crossed a line.

Exclusion through group chats

Being quietly removed from, or never added to, the WhatsApp or Viber groups that carry class updates, tuition schedules, or weekend plans. Because these groups also serve a real, practical purpose, exclusion here can be dressed up as accidental — which makes it easy for a bystander, or even a parent, to miss what it actually is.

EXAMPLE

A group of girls creates a new class group ahead of the O/L term and — without a word said to anyone — does not add one particular classmate, who only realises what happened when she is the only one who doesn't know about a schedule change.

Harassment and pile-ons

Repeated insulting, threatening, or mocking messages, sent either directly or inside a shared group where several children join in at once. The group setting often makes this feel bigger and more public than a one-to-one argument, and it can be hard for any single child in the group to be the one who objects.

Impersonation and fake accounts

Creating a fake profile using a child's name, school, and photographs, sometimes to post embarrassing or false things “as” them. This is particularly disorienting for a child, because the harm is being done publicly in their own name, often without their knowledge until someone else mentions it.

Sharing private material without consent

Forwarding a screenshot of a private conversation, a photo sent in confidence, or personal information, to an audience it was never meant for — sometimes as gossip, sometimes deliberately to humiliate. Where the material is intimate or a threat is attached to withhold or share it, this becomes image-based abuse, sometimes called “sextortion,” and is a criminal matter, not just a school disciplinary one.

Public shaming

Posting a photo, video, or recording of a child specifically to invite mockery — sometimes a moment caught during a school event, sometimes something manufactured, like a candid photo taken without their knowledge. In a small school community, this kind of content can circulate startlingly fast, well beyond the original group of friends.

Trolling in gaming spaces

Targeted insults, threats, or exclusion through voice chat or messaging inside online multiplayer games — spaces many parents never see directly, and where a child may spend hours with people they have never met in person.

3. It Looks Different at Every Age

A blanket set of rules rarely fits both a nine-year-old and a seventeen-year-old, and treating them the same tends to either overprotect the older one or under-prepare the younger one. It helps to think in rough bands, adjusting for your own child's maturity rather than their exact age.

Ages 7–10 — mostly supervised access

Most children this age are using a shared family device or tablet, often for games, YouTube, or messaging relatives, under at least some adult presence. Unkindness at this age tends to show up inside game apps (Roblox, mobile games with chat features) or YouTube comment sections, and because a parent is often nearby, it is usually visible if you are paying attention. This is the easiest stage to build good habits in: sit with your child while they are online, narrate what you are both seeing, and use it as a low-stakes moment to talk about kindness online before the stakes get higher.

Ages 10–12 — the first personal phone

This is the stage where a first personal phone commonly appears in Sri Lankan households — frequently justified, reasonably, by the need to coordinate tuition classes and after-school arrangements. It is also, not coincidentally, the age band the national data flags as the average point of first real internet access. WhatsApp and class group chats become central to daily social life almost overnight. The single most useful thing a parent can do here is agree on ground rules before the phone arrives, not after the first problem — and where practical, being part of the same class parent or student groups your child is in gives you real visibility without needing to check their phone directly.

Ages 13–15 — more apps, more autonomy

By the O/L years, most children have moved on to TikTok, Instagram, and increasingly independent phone use, and peer approval starts to matter intensely — which is developmentally normal, not a warning sign in itself. This is also the age where image-sharing risk rises sharply, and where a first relationship, and its ending, may play out partly or entirely online. The useful shift for a parent here is from control to coaching: you will see less directly, so the conversations you have in advance, about consent, screenshots, and what to do if something goes wrong, matter more than any single rule.

Ages 16–18 — a near-adult digital life

A/L students are managing an online presence that increasingly overlaps with their adult life — friendships, romantic relationships, and for many, an academic identity tied to intense exam pressure and competitive rankings, which can itself become a target for online mockery around results season. At this stage, most of the direct value a parent can add comes from being a calm, non-judgemental resource your child would actually choose to come to — not from oversight, which teenagers this age will usually find ways around regardless of the rules in place.

4. Warning Signs & Symptoms to Watch For

Most children do not tell a parent when they are being cyberbullied — not because they don't trust you, but out of fear of losing the phone, embarrassment, or a wish to handle it themselves. This is precisely why watching for changes in behaviour tends to be more reliable than waiting to be told directly.

Sudden mood changes

Trouble sleeping

Avoiding or over-using their device

Falling grades

Withdrawing from friends & family

Headaches or stomach aches

Six common warning signs of cyberbullying, at a glance

Emotional and behavioural signs

- Becoming withdrawn, anxious, tearful or unusually irritable, especially after using their phone or computer
- Sudden mood changes when a notification, message or call comes in
- Loss of interest in activities, friends, or school that they used to enjoy
- Trouble sleeping, nightmares, or appearing tired and on edge
- Increased secrecy about online activity, or quickly switching screens/hiding the phone when a parent approaches

Physical and academic signs

- Unexplained headaches, stomach aches, or reluctance to go to school
- Falling grades or difficulty concentrating on schoolwork
- Changes in eating or appetite

Changes in device use

- Avoiding their phone altogether, or conversely, becoming obsessively attached to it
- Closing or deleting social media accounts suddenly
- Being upset after going online, but refusing to say why

Remember

- No single sign proves cyberbullying is happening — several of these overlap with ordinary teenage moodiness, exam stress, or simply a bad week. Look at the pattern and the timing (does it track with phone use?) rather than any one sign in isolation, and trust your instinct if something feels different about your child.

5. The Effects — Short Term and Long Term

Because cyberbullying happens on a screen, it is sometimes underestimated compared with in-person bullying. Research on the topic consistently points the other way: the effects can be at least as serious, and in some respects worse, precisely because there is no escape from it — it can follow a child home — and because the potential audience feels limitless rather than confined to a classroom or playground.

The three broad areas cyberbullying tends to affect

Emotional and psychological effects

- Anxiety, low self-esteem, and a persistent sense of shame, even though the child has done nothing wrong
- Increased risk of depression, and in more serious cases, self-harm or suicidal thoughts
- Hypervigilance — a felt sense of not being safe even at home, since the phone can deliver the harassment anywhere

Social effects

- Withdrawal from friendships and family relationships, sometimes including friends who had nothing to do with it
- Reluctance to attend school, tuition classes, or social events where the people involved might be present
- Difficulty trusting others, which can outlast the bullying itself by months

Academic effects

- Falling concentration and school performance, particularly in a system where continuous assessment and exam performance carry heavy weight
- Increased absenteeism, sometimes disguised as physical illness (see the warning signs above)

There is a genuinely hopeful side to this, though it should not be used to minimise what a child is going through: children are resilient, and with early, calm support from a parent — and professional help where it is needed — most recover well. The research is fairly consistent that how a parent responds in the very first conversation shapes how quickly a child is willing to keep talking, which is a large part of why Section 7 is worth reading carefully, in advance, before you need it.

6. If Your Child Is the One Being Unkind, or Watching It Happen

This is the section most guides skip, usually because it is uncomfortable to consider. But cyberbullying is rarely a two-person story of a victim and a lone aggressor — it typically involves a wider group who join in, forward things along, laugh, or simply watch and say nothing. Every child in that wider circle is someone's child, and any of them could be yours.

If you suspect your child is involved in bullying someone

Signs worth paying attention to include: other parents or teachers raising concerns, your child being secretive and amused around their phone in a way that feels pointed rather than private, or your own accidental glimpse of a message that doesn't sit right. It helps to resist two opposite instincts here — dismissing it as “just kids messing around,” and reacting purely with punishment. Neither tends to change the behaviour. Children who bully others are often, though not always, dealing with something of their own: a wish for status or belonging, imitation of older siblings or adults, boredom, or their own unresolved experience of being excluded or hurt. Understanding the cause is not the same as excusing the behaviour — it is what makes it possible to actually change it. A useful approach is to stay calm, ask what happened without leading the answer, hold your child concretely accountable (a genuine apology, stepping back from the group behaviour, and where appropriate, restitution), and address the underlying driver directly rather than only the incident.

Parent: *Your teacher called me today. She showed me some messages from the class group with your name on them, about Kasun. I want to hear this from you — what's been going on?*

Child: *It's just jokes, everyone does it. Kasun doesn't even care.*

Parent: *I saw the messages, so I don't think that's true, and I think you know that too. I'm not here to shout at you — I want to understand. Did something happen between you two? Or with the group?*

Child: *...He got the top mark and the teacher said his name in front of everyone. It just made me angry. And the others were already saying stuff, so I joined in.*

Parent: *That's a real feeling, and thank you for telling me the truth. It still doesn't make it okay — Kasun didn't do anything to deserve that. Tonight you're going to write him a proper apology, not a group-chat one, and you're stepping out of that chat. And let's talk about what was actually going on for you, because that part matters too.*

If your child is a bystander

Most children who witness cyberbullying do nothing — not out of cruelty, but because stepping in publicly feels risky, and because a group chat can make silence feel like the safest option. It is worth talking to your child explicitly about this, because a few concrete, low-risk actions make a real difference: privately checking on the person being targeted rather than saying anything in the group, declining to forward or react to the content (even a laughing emoji counts as participation), and telling a trusted adult — which is not “telling tales,” but exactly the kind of quiet action this guide keeps asking every child to take.

Parent: You mentioned Nadeesha got left out of the group again. What did you do when you saw the messages about it?

Child: Nothing, really. I didn't send anything mean.

Parent: That makes sense — you didn't want to make it worse. Would it feel possible to just message her directly, privately, to check she's okay? That's not picking a side, it's just being decent.

PARENTING WITH PURPOSE: NAVIGATING CYBERBULLYING ACCOUNTABILITY.

Listening, Understanding, Guiding.

7. How to Talk With Your Child

How you respond in the first few minutes — of finding out, or of asking — matters more than almost anything else in this guide. Many children stay silent specifically because they fear losing their phone, being blamed, or making the situation worse by speaking up. The goal of a first conversation is to keep the door open, not to solve everything in one sitting.

If your child comes to you

- Stay calm. A calm reaction, even if you feel alarmed inside, tells your child it is safe to keep talking.
- Thank them for telling you — this took real courage, and saying so out loud matters.
- Listen fully before reacting. Let them finish the story before offering solutions or judgement.
- Reassure them it is not their fault, specifically and out loud, rather than assuming they already know.
- Ask open questions rather than leading ones: how long has this been happening, who else knows, what would help them feel safer right now.

If you notice signs and need to raise it yourself

This is harder, because you are opening a conversation your child hasn't chosen to have. Lead with the specific behaviour you've noticed rather than a general “is everything okay,” which is easy to deflect.

Parent: *I've noticed you've been a lot quieter after your phone buzzes, and you were up late again last night. I'm not upset with you — I just want to understand what's going on so I can help, if there's anything to help with.*

Child: *It's nothing, I'm fine.*

Parent: *Okay — I'm not going to push. But I'm going to ask again in a day or two, and I'd rather you tell me something small now than something big later. I'm on your side, whatever it turns out to be.*

If the first attempt is met with silence, that is normal, not a failure — revisit it gently in a day or two rather than pressing hard in the moment.

Do

- Ask before acting. Before messaging the other child's parents, the school, or the police, check what your child is comfortable with — sudden action can feel like a loss of control for them, on top of everything else.
- Keep evidence together calmly: screenshots, usernames, dates and times, without making your child relive it more than necessary in the process.
- Check in regularly afterwards, even once things seem to have settled — the effects often linger past the point where the messages stop.

Avoid

- Taking away the phone or internet access as a first response — this is often what children fear most, and it reliably teaches them not to tell you next time.
 - Instead, agree together on any changes to device use, as a joint decision rather than a punishment.
- Blaming or questioning their choices (“Why did you post that?” “Why were you talking to that person?”) — even asked gently, these land as blame.
- Minimising it (“Just ignore it,” “It’s just the internet, it’s not real”) — for your child, it is entirely real.
- Confronting the other child or their parents directly, or posting about it publicly, without your child’s agreement — this can escalate the situation and damage your child’s trust in you at the same time.
- Promising complete secrecy if the situation involves serious risk — be honest that you may need to involve the school or authorities, and explain why, rather than making a promise you may need to break.

8. What To Do, Step by Step

- **1. Stay calm and listen — let your child tell their story fully before responding.**
- **2. Do not respond to or retaliate against the person responsible, and ask your child not to either — replying, even to defend themselves, tends to prolong it.**
- **3. Save the evidence — screenshots of messages, posts, profiles and comments, including usernames and dates, before anything can be deleted.**
- **4. Use in-app tools — block the person, and report the content or account directly on the platform (WhatsApp, Facebook, Instagram, TikTok, etc.).**
- **5. Decide together who else needs to know — the school, if a student is involved, and the appropriate Sri Lankan authority if needed (see Sections 10 and 11).**
- **6. Support your child’s wellbeing directly — a school counsellor, GP, or one of the helplines in Section 12, especially if distress lasts more than a couple of weeks or starts affecting sleep, eating, or school attendance.**
- **7. Review privacy and safety settings together afterwards, framed as a joint precaution rather than a consequence.**

9. Simple Rules to Share With Your Child

Alongside your own actions as a parent, it helps to give your child a few simple rules of their own, gone through together in their own language rather than handed over as a list to memorise.

- **Don't hit back.** Replying to an unkind message, even to defend yourself, usually fuels the situation rather than ending it.
- Keep the proof. Before blocking or deleting anything, take a screenshot — it may be needed later for a report.
- Block first, argue never. Blocking or muting the person is not “losing” — it takes away their audience, which is usually the point.
- Tell someone you trust. A parent, an older sibling, a teacher, or a school counsellor — the earlier someone in your corner knows, the sooner it can stop.
- It is allowed to log off. Stepping away from a group chat or app for a while is a reasonable response to feeling overwhelmed, not a defeat.
- None of this is your fault. Whatever was said or shared, the responsibility sits with the person doing the bullying — not with you.

For your child to remember

- You are never alone in this, and asking for help is one of the strongest things you can do.

Supporting someone through cyberbullying isn't just about standing against the harm done; it's about standing firmly together to rebuild their confidence, reminding them that they are never alone.

10. Working With the School

Where a classmate or someone from the same school is involved, the school is often the fastest route to actually stopping the behaviour day-to-day — it can act on seating, group placements, and supervision in ways no outside authority can. It is worth going in with realistic expectations, though: Sri Lanka does not yet have a single, standardised anti-bullying policy that every school is required to follow, so how a complaint is handled varies noticeably from one school to another. Some already have trained counsellors and a clear process; others are still building one. That is a reason to be organised going in, not a reason to skip this step.

Making it count

- Ask specifically who handles this — the class teacher, a school counsellor, or the principal — rather than raising it informally in a general conversation that may not get followed up.
- Put the key facts in writing (even a short email or letter), including dates and what you are asking the school to do. A written record is easier for a school to act on, and easier for you to refer back to if things don't improve.
- Bring your saved evidence, but let the school know your child's wellbeing is the priority — you are not looking to punish another child publicly, which can itself become a new source of shaming.
- Agree on a follow-up point — a date to check in again — rather than leaving it open-ended.

WORTH KNOWING

A 2025 amendment to Sri Lanka's Penal Code extended the existing ban on corporal punishment in schools to cover psychological humiliation as well — meaning a teacher or principal publicly shaming a child, even as a disciplinary response to bullying, is not an appropriate or lawful way for a school to handle it either. If that happens, it is reasonable to raise it as a separate concern.

11. How to Report Cyberbullying in Sri Lanka

Five steps for a Sri Lankan parent to follow, in order

Step 1: Report on the platform

Most major platforms (WhatsApp, Facebook, Instagram, TikTok, YouTube) have a built-in "Report" option on messages, posts, comments or profiles. Reporting and blocking should usually be the first step for content that violates the platform's own rules, such as harassment or fake accounts.

Step 2: Involve the school, if a student is involved

See Section 10 for how to make this count — informing the class teacher, school counsellor, or principal allows the school to act through its own processes, alongside anything else you do.

Step 3: Report to the National Child Protection Authority (NCPA)

For any concern involving a child under 18 — including cyberbullying, harassment, or exploitation — you can call the NCPA's 24-hour Childline on 1929, free of charge from any network, in Sinhala, Tamil or English. Reports are treated confidentially.

Step 4: Report to Sri Lanka CERT|CC

Sri Lanka CERT|CC (the Computer Emergency Readiness Team) handles reports of cyberbullying, fake profiles, harassment and defamation online. You can report an incident through their online portal at cert.gov.lk, by emailing report@cert.gov.lk, or by calling 011 269 1692. CERT can advise on securing accounts, removing harmful content, and liaising with social media platforms.

Step 5: Report to the Police, for criminal matters

If the cyberbullying involves threats, blackmail, image-based abuse, stalking or other criminal behaviour, you can file a complaint with the Computer Crime Investigation Division (CCID) of the Police Criminal Investigation Department, by phone on 011 238 1045 or by email to dir.ccid@police.gov.lk. Bring your saved evidence (screenshots, links, dates). In an emergency involving immediate danger, call 119 or 118.

Good to know

- You do not have to choose only one option. Many families report to the school, the NCPA, and the platform at the same time — the routes are complementary, not exclusive.
- All the agencies above are legally required to keep child-related reports confidential.

12. Helplines & Contacts Directory

Organisation	Contact	What they help with
NCPA Childline (1929)	1929	Free, 24/7, confidential. For any child-abuse or child-safety concern, including cyberbullying. Available in Sinhala, Tamil and English.
Sri Lanka CERT CC	011 269 1692 / report@cert.gov.lk	Report cyberbullying, fake profiles, harassment, defamation or hacked accounts online at cert.gov.lk/report_incident.
Police CCID (Cyber Crime)	011 238 1045	For criminal complaints such as threats, blackmail, image-based abuse or serious harassment. Email dir.ccid@police.gov.lk.
Police Emergency	119 / 118	For any situation involving immediate danger to your child.
Hithawathi	Counselling 077 567 6555 · Legal 076 868 6555	Confidential online-safety helpline and counselling for issues in cyberspace.
1938 Women & Children's Bureau	1938	Ministry of Women & Child Affairs helpline.
National Institute of Mental Health	1926 / WhatsApp +94 75 555 1926	Mental-health support helpline.
Sumithrayo	011 268 2535 / 011 268 2570	Emotional support and suicide-prevention helpline.

Tip: Save these numbers in your phone under a clear name (e.g. “1929 – Child Helpline”) so they are easy to find quickly if your child ever needs to reach you to them, or vice versa.

13. Building Healthy Digital Habits

Prevention works best woven into ordinary family life well before a first phone appears, rather than introduced as a reaction to a problem. A few practices make a disproportionate difference:

Before the first phone

- Agree on a simple family media agreement together — when devices are used, where they stay overnight, and which apps are allowed — before the phone arrives, not after the first disagreement about it.
- Talk through what to do if something goes wrong before it happens, the same way you'd talk through what to do if they got lost in town: it lowers the stakes of ever needing to ask for help.

Ongoing habits, at any age

- Learn the platforms your child uses. You don't need to be an expert, but understanding group chats, disappearing messages, and basic privacy settings makes your conversations genuinely informed rather than guesswork.
- Sit down together, once or twice a year, and actually review privacy settings on their accounts — who can message them, who can see their posts, whether their location is visible.
- Teach the pause: before posting or forwarding anything, a beat of “would I be okay if this were about me” catches a surprising amount before it's sent.
- Model it yourself — children notice, more than parents usually assume, how the adults around them talk about other people online.
- Build a “tell an adult, not a punishment” culture explicitly and repeatedly, not just once: say plainly, and often, that coming to you leads to support, not consequences.
- Invest in offline friendships and activities — sport, faith communities, hobbies — that give your child a sense of worth that doesn't depend on how a post performs online.

14. A Note on Culture, Shame & Silence

In many Sri Lankan families, children hesitate to talk about being bullied online because they fear bringing “shame” on the family, being blamed for their own online behaviour, or simply having their phone and freedoms taken away. Girls in particular often fear being blamed for photos or messages shared without their consent, even when they did nothing wrong — which is precisely the dynamic that keeps the most serious cases hidden the longest.

As a parent, actively signalling — in words, not just intentions — that your child will not be blamed, and that asking for help is a sign of strength rather than weakness, makes a real, measurable difference in whether they come to you early, while a situation is still manageable, rather than after it has grown serious.

If your child's school, religious community, or extended family plays a meaningful role in their life, it can help to gently extend the same message through those channels: cyberbullying is never the target's fault, and support should always come before blame.

15. Looking After Yourself, Too

Finding out your child is being hurt — or has hurt someone else — online is genuinely distressing, and it is easy to pour every ounce of attention into your child while quietly running on empty yourself. That isn't sustainable, and it isn't necessary.

It's reasonable to feel angry, helpless, or guilty for not noticing sooner — most parents in this situation feel at least one of those things, often all three. Talking it through with your partner, a friend,

or a counsellor is not a distraction from helping your child; a parent who is coping is, in practice, a steadier and more available one. Several of the helplines in Section 12, including Hithawathi and the National Institute of Mental Health, are there for parents as much as for children — you are welcome to use them too.

This manual is intended as general guidance for parents and caregivers in Sri Lanka. It does not replace professional legal, medical or psychological advice. If your child is in immediate danger, contact the Police on 119/118 without delay.

YOU ARE NOT ALONE

If your child is being cyberbullied, help is always available — free, confidential, and just a call away.
